Sample Questions and Model Answers from June 2013 Paper

While the actual exam questions are proprietary, typical examples include:

Example 1: Investigating Enzyme Activity
Question: Describe an experimental method to investigate the effect of temperature on enzyme activity. Include the controls you would use.
Model Answer: To investigate the effect of temperature on enzyme activity, prepare a series of test tubes containing a fixed concentration of substrate and enzyme. Incubate each tube at different temperatures (e.g., 0°C, 20°C, 40°C, 60°C). Measure the amount of product

formed over a fixed period using an appropriate method, such as spectrophotometry. Controls should include a test tube kept at a temperature where enzyme activity is known to be optimal and a blank with no enzyme to account for non-enzymatic reactions. Ensure all other conditions, such as pH and substrate concentration, are kept constant.

Example 2: Data Interpretation
Question: Given a graph showing enzyme activity at various pH levels, identify the optimum pH and explain how enzyme activity changes outside this optimum.
Model Answer: The enzyme activity peaks at pH 7.0, indicating this is the optimum pH. Outside this pH, enzyme activity decreases due to denaturation or changes in the ionic bonds within the enzyme's active site, leading to less efficient substrate binding. Acidic or alkaline conditions can alter the enzyme's shape, reducing its catalytic efficiency.
