A) To cool the refrigerant
B) To compress the refrigerant vapor, raising its pressure and temperature
C) To expand the refrigerant into a low-pressure liquid
D) To remove heat from the surroundings

Answer: B) To compress the refrigerant vapor, raising its pressure and temperature.

Explanation: The compressor is a vital component that compresses low-pressure, low-temperature refrigerant vapor into a high-pressure, high-temperature vapor, enabling heat to be expelled in the condenser. This

process is essential for maintaining the refrigeration cycle and ensuring continuous heat transfer.

Question 2: Which component is responsible for removing heat from the refrigerant in the condenser?

A) Evaporator B) Compressor C) Condenser D) Expansion valve

Answer: C) Condenser.

Explanation: The condenser's role is to reject heat from the high-pressure refrigerant vapor, causing it to condense into a high-pressure liquid. This process releases the heat to the surroundings, which can be air or water-cooled depending on the system design.

Question 3: What is the purpose of the expansion valve in a refrigeration cycle?

A) To compress the refrigerant B) To control the flow of refrigerant into the evaporator and reduce its pressure C) To absorb heat from the environment D) To circulate oil within the system

Answer: B) To control the flow of refrigerant into the evaporator and reduce its pressure.
