Detailed Answers and Explanations for Practice Questions

Below are sample questions similar to those found in Carnegie Learning Lesson Skills Practice 6, along with thorough solutions and tips.

Question 1: Solving a Linear Equation

Solve for x : $3x + 5 = 2x - 7$

Answer: To solve for x ,

follow these steps: Subtract $2x$ from both sides: $3x - 2x + 5 = -7$ Simplify: $x + 5 = -7$ Subtract 5 from both sides: $x = -7 - 5$ Simplify: $x = -12$ Final answer: $x = -12$ Explanation: This problem demonstrates the importance of isolating the variable on one side of the equation by using inverse operations? subtracting $2x$ to collect like terms, then subtracting 5 to solve for x .

Question 2: Graphing a Linear Function Graph the linear function $y = 2x - 3$. **Answer and Tips:** To graph $y = 2x - 3$, identify the y -intercept and slope. Y -intercept: $(0, -3)$ Slope: 2 (rise over run) Plot the y -intercept on the coordinate plane. From the y -intercept, use the slope to find another point: Rise 2 units up, run 1 unit right: $(0, -3)$ to $(1, -1)$ Plot this second point and draw a straight line through both points. Tip: Use a table of values for additional points to ensure accuracy.

Question 3: Solving a System of Equations by Substitution Solve the system:
$$\begin{cases} y = 3x + 4 \\ 2x - y = 1 \end{cases}$$
 Answer: Step-by-step solution: Substitute y from the first equation into the second: $2x - (3x + 4) = 1$ Distribute and combine like terms: $2x - 3x - 4 = 1$ $\rightarrow -x - 4 = 1$ Add 4 to both sides: $-x = 5$ $\rightarrow x = -5$ Substitute $x = -5$ into $y = 3x + 4$: $y = 3(-5) + 4 = -15 + 4 = -11$ Final answer: $x = -5$, $y = -11$ Explanation: Using substitution simplifies solving systems when one equation is already solved for a variable. Carefully perform each substitution and check your work by plugging values back into the original equations.

Question 4: Word Problem ? Linear Relationship The cost C (in dollars) to rent a bike is modeled by the equation $C = 15 + 3h$, where h is the number of hours rented. How much does it cost to rent a bike for 4 hours? **Answer:** Substitute $h = 4$ into the equation: $C = 15 + 3(4) = 15 + 12 = 27$ Final answer: It costs \$27 to rent the bike for 4 hours. Explanation: This problem demonstrates translating a real-world scenario into a linear equation and evaluating it for specific values.

Question 5: Inequalities and Graphing Graph the solution to the inequality: $y \geq 2x + 1$. **Answer and Steps:** Graph the boundary line $y = 2x + 1$: Plot the y -intercept $(0, 1)$. Use the slope 2 to find another point: from $(0, 1)$, go up 2 units, right 1 unit to $(1, 3)$. Draw the line; since the inequality is $\geq$, the boundary line is solid. Shade the region above the line because y is greater than or equal to $2x + 1$. Tip: Use test points like $(0, 0)$ to verify which side to shade: Plug into the inequality: $0 \geq 2(0) + 1 \geq 0 \geq 1$? No, so shade the opposite side of the line from $(0, 0)$.

Strategies for Success with Carnegie Learning Lesson Skills Practice 6 To excel in these exercises, consider the following tips:

1. Understand the Concept Before Solving Grasp the underlying principles of linear equations, functions, and inequalities. Review key properties, such as the distributive property, properties of equality, and slope-intercept form.
