Fundamentals of Fluid Mechanics

Fluid mechanics is the branch of physics concerned with the behavior of fluids at rest and in motion. Its principles underpin the design and analysis of hydraulic systems, turbines, pumps, and various other devices.

Properties of Fluids

Understanding fluid behavior begins with its physical properties:

- Density (ρ):** Mass per unit volume (kg/m^3). It influences buoyancy, pressure, and flow characteristics.
- Viscosity (μ):** Measure of a fluid's internal resistance to flow ($\text{Pa}\cdot\text{s}$). Higher viscosity implies a more viscous fluid.
- Pressure (P):** Force exerted per unit area (Pa). It acts perpendicular to the surface within the fluid.
- Velocity (V):** The speed of fluid particles at a point (m/s).
- Surface Tension:** The force at the fluid's surface due to cohesive forces, significant in small-scale phenomena.
- Compressibility:** Tendency of a fluid to change volume under pressure. Liquids are generally incompressible, gases are compressible.

Basic Principles and Laws

- Pascal's Law:** Pressure applied to an enclosed incompressible fluid is transmitted uniformly throughout the fluid.
- Archimedes' Principle:** A body submerged in a fluid experiences an upward buoyant force equal to the weight of displaced fluid.
- Continuity Equation:** For incompressible flows, the mass flow rate remains constant: $A_1 V_1 = A_2 V_2$ where A is cross-sectional area and V is velocity.
- Bernoulli's Equation:** Energy conservation in steady, incompressible, non-viscous flow: $P + \frac{1}{2} \rho V^2 + \rho g h = \text{constant}$ where P is pressure, ρ is density, V is velocity, g gravity, and h elevation.

Types of Fluid Flow

Understanding flow types is crucial for analyzing fluid behavior:

- Laminar vs. Turbulent Flow**
- Laminar Flow:** Smooth, orderly flow where fluid particles move in parallel layers. Predominant at low velocities or high viscosities. Characterized by Reynolds number (Re) less than approximately 2000.
- Turbulent Flow:** Chaotic, mixing flow with vortices and eddies. Occurs at higher velocities or lower viscosities ($Re > 4000$). Turbulence increases energy loss but enhances mixing.

Flow Regimes and Transitions

Transition from laminar to turbulent flow occurs within the Reynolds number range of 2000–4000. Factors influencing flow regime include velocity, fluid properties, and pipe roughness.
